Is chemical storage a promising option for long term storage of energy?

With respect to these observations, the chemical storage is one of the promising options for long term storage of energy. From all these previous studies, this paper presents a complete evaluation of the energy (section 2) and economic (section 3) costs for the four selected fuels: H₂, NH₃, CH₄, and CH₃OH.

How much does it cost to transport hydrogen?

Hydrogen in gas phase transported by pipeline is evaluated at 492 EUR/MWh H₂, and 239 EUR/MWh H₂ in liquid phase (in a truck). Storage of hydrogen in gas phase is the most expensive part of the process. This cost is due to the huge volume of storage required for 1 kg of hydrogen gas. The total cost of ammonia is moderate at 261 EUR/MWh NH₃, by pipeline.

How much does CH₄ cost?

The storage and the transport of CH₄ are not problematic, with a reduced cost. The global cost of CH₄ is estimated at 262 EUR/MWh CH₄, with a transport by pipeline. The CH₄ production can be directly connected to the already well-established natural gas network. The entire industrial combustion processes are also suitable for this fuel.
